PROJECT REPORT:-

- NAME: Krishna Singh
- REGISTRATION NO.: 25BAI10124
- BRANCH: AIML
- YEAR: 1ST Year
- COURSE CODE: CSE0001
- DATE: 25th March 2026

Introduction:

This project is all about helping students like me, to become more aware of digital literacy and how to stay safe online. With so much of our daily life happening on the internet—whether it’s studying, coding, social networking, or making payments—it’s really important to understand how to use digital tools responsibly. The goal of this project was not just to improve my own skills, but also to create useful resources that can guide my peers in navigating the online world safely and confidently.

For the scenario, I focused on UPI/Online Payment Fraud, which is becoming increasingly common among students in India. This type of fraud usually involves tricking people into sharing sensitive financial information through fake messages, links, or apps. By researching a realistic case study, understanding how such scams happen, and creating a prevention checklist, I wanted to highlight the risks and give practical tips to avoid them. Overall, this project combines learning, awareness, and actionable advice to help students be safer and smarter online.

Task 1:

I made my infographic using Canva because it’s really simple to use and has a lot of ready-made templates that make designing much easier. In my design, I focused on three main areas of digital literacy: what digital literacy actually means, how to stay safe on the internet, and some basic email etiquette. I explained digital literacy as the ability to use digital tools in a smart and responsible way. I also included a few important safety tips like not sharing personal information, using strong passwords, and being careful while clicking on unknown links. For email etiquette, I added points like writing proper subject lines, being polite, and checking messages before sending them.

While working on this infographic, I tried to keep everything simple and easy to understand so that anyone can quickly go through it. I used icons and short text instead of long paragraphs to make it more visually appealing. One thing I found a bit difficult was deciding how much information to include without making it look too crowded. But at the same time, it was actually fun to experiment with different designs and see how small changes can make the infographic look much better and more engaging.

Task 2:

For this task, I worked on creating and updating my profiles on GitHub, LinkedIn, and Stack Overflow. Each of these platforms is useful in its own way and helps in learning different things. GitHub is mainly for sharing code and projects, so I created my profile README and added basic details about myself along with what I want to learn in the future. LinkedIn is more about building a professional profile, so I updated my education section with my current degree and expected graduation year. Stack Overflow is a platform where people ask and answer coding-related questions, which makes it really helpful when you get stuck while programming.

In the next four years, I plan to use GitHub regularly to upload my projects and track my progress. I'll use LinkedIn to connect with people, explore opportunities, and stay updated about what's happening in the industry. On Stack Overflow, I'll mostly use it to find solutions to my doubts, and hopefully, as I learn more, I can start helping others too. Overall, I think these platforms will really help me improve my skills and grow step by step everyday!

Task 3:

For this task, I used HackerRank for coding practice and Google Forms for the collaboration part. On HackerRank, I tried a beginner-level problem, which was actually a nice way to get started with coding practice. It helped me understand how to think step by step and apply basic logic to solve a problem. Even though it was simple, it gave me a bit of confidence to try more challenges later on.

For the second part, I created a Google Form as a “Digital Literacy Awareness Quiz” with exactly five questions. I made sure to include both multiple-choice and short-answer questions so that it’s not just easy to answer but also a bit engaging. I also connected the form to a Google Sheet, which automatically stores all the responses and makes it really easy to view everything in one place.

Overall, this task made me realize how useful these tools are for studies. HackerRank can help me improve my coding skills with regular practice, and Google Forms is really helpful for creating surveys, quizzes, and even collecting data for projects. I feel like I’ll definitely use both of these in my academic work going forward.

Task 4:

One situation where poor digital communication can create serious problems is when a student sends a careless or unclear email to a professor. For example, if a student writes something very short like “I’ll submit later” without any proper explanation, greeting, or polite tone, it can sound rude or unprofessional. The professor might not understand the reason behind the delay or may even choose to ignore the message, which could result in losing marks or missing the deadline entirely. Sometimes, even the intention might be genuine, but the way it is communicated creates a negative impression.

This kind of issue can easily be avoided with a little more effort and awareness. The student should clearly explain the situation, use a respectful and polite tone, and structure the email properly with a clear subject and greeting. Simple things like being courteous and giving enough context can make communication much more effective and avoid unnecessary misunderstandings.

Task 5:

While researching cybercrimes, I was honestly surprised at how easily even careful people can become victims of scams like phishing or online payment fraud. I didn’t realize that attackers can create fake websites, emails, or messages that look almost exactly like the real ones, tricking people into sharing sensitive information without suspecting anything. What really stood out to me was how quickly a small mistake, like clicking an unknown link or sharing an OTP, can lead to serious consequences such as financial loss, identity theft, or even long-term stress and reputation damage.

As a result, one habit I want to change in my own online life is being much more cautious with financial transactions and personal information. I plan to always double-check URLs, never share OTPs or UPI PINs, and verify messages before responding or clicking any links. I also want to be more aware of my overall digital footprint and encourage my friends to do the same. Building this habit will not only help me stay safer online but also allow me, as a Digital Ambassador, to guide my peers toward smarter, safer online practices.

Conclusion:

This project has been a really eye-opening experience, and I learned a lot about the importance of digital literacy and safe online behavior. I realized that even small mistakes, like clicking on unknown links, sharing personal or financial information, or posting carelessly on social media, can lead to serious consequences. Through the different tasks—creating professional profiles, practicing coding challenges, writing formal emails, and studying cybercrime scenarios—I gained practical skills that I can use every day. It also made me reflect on my own digital habits and think about ways to be more cautious and responsible. Beyond just learning for myself, this project gave me the chance to create resources that can help my peers navigate the online world more safely. Overall, it reinforced the idea that awareness, careful behavior, and continuous learning are essential for being a confident and responsible digital citizen.
